

# Campaign Approval App UX Review & Improvement Recommendations

---

Review focus: client approval flow, QA usefulness, change requests, revision tracking, workflow value, feature opportunities, and pricing

## Overall assessment

The approval link generation and campaign preview experience are strong. The main opportunity is to turn the current change-request interaction from a one-time email notification into a complete, trackable revision workflow.

Sample report reviewed: [SendCleared review link](#)

Date: 22 August 2026

## 1. Executive Summary

SendCleared already solves an important part of the campaign approval process: it creates a shareable approval link, presents the campaign in a clean preview, and allows a reviewer to approve or request changes without needing a complex onboarding process.

The biggest gap appears after a reviewer selects “Request Changes.” The feedback is successfully emailed to the freelancer or agency, but the app does not visibly continue the workflow. There is no clear revision log, no change-request status, and no obvious next action for either side. This creates a risk that the work falls back into email threads, which weakens the value of having a centralized approval platform in the first place. Beyond approvals, the QA layer can also be valuable to an Email Marketing Specialist if it becomes a consistent pre-send checklist across clients and ESPs. At \$19/month, however, the value proposition may feel slightly high for a solo freelancer unless the product saves enough review time or includes deeper QA and revision-management features.

### Key conclusion

#### Highest-priority improvement

Create a closed-loop revision workflow: every requested change should be stored in-app, tied to the campaign version, given a status, and carried forward until it is resolved and the updated campaign is resubmitted for approval.

## 2. What Is Working Well

- Approval link generation works well and supports a simple client-review experience.
- The campaign preview is clear and visually suitable for client review.
- The “Request Changes” action successfully captures reviewer feedback and notifies the freelancer/agency by email.
- The confirmation screen communicates that the feedback has been sent, which reassures the reviewer that their action was received.
- The documented approval record can give agencies and freelancers a more professional sign-off process than relying on informal email or chat confirmations.
- A platform that works consistently across multiple clients and ESPs can reduce the need to maintain separate approval processes for each account.

## 3. Main UX Gap: Change Requests Are Not Tracked End-to-End

At present, the change request appears to behave more like an email notification than a workflow object. The reviewer submits feedback, the freelancer receives an email, and the app displays a success message. However, the request itself is not clearly tracked through revision, resolution, resubmission, and final approval.

| # | Workflow Step | Status | Observation |
|---|---------------|--------|-------------|
|---|---------------|--------|-------------|

|   |                                               |       |                                                                                         |
|---|-----------------------------------------------|-------|-----------------------------------------------------------------------------------------|
| 1 | Reviewer clicks “Request Changes”             | Works | Feedback is submitted.                                                                  |
| 2 | Freelancer/agency receives email              | Works | Notification reaches the person responsible for making changes.                         |
| 3 | Change request is stored and visible in-app   | Gap   | There should be a persistent record of what was requested.                              |
| 4 | Freelancer marks feedback as addressed        | Gap   | No clear status such as Open, In Progress, Resolved.                                    |
| 5 | Updated version is resubmitted                | Gap   | The system should guide the freelancer to submit a new version against the same review. |
| 6 | Reviewer sees what changed and approves again | Gap   | The reviewer should return to the latest revision with prior feedback retained.         |

## 4. Evidence from the Current Experience

### 4.1 Change-request notification

The current notification correctly records the reviewer’s feedback in the email/message received by the freelancer. This is useful, but the platform should also preserve this information as part of the campaign’s own activity history.

Figure 1. Change request received by the freelancer/agency.

### 4.2 Post-submission confirmation

After the reviewer submits feedback, the success screen confirms that the message has been sent. The weakness is that the page does not provide a meaningful next step. The reviewer is left at a dead end and cannot easily see the request status, return to the review, edit the feedback, or understand what will happen next.

Figure 2. Current confirmation state after a change request is submitted.

### Recommended confirmation-state actions

- Show a status badge such as “Changes Requested” with the submission timestamp.
- Add a “View Request” button so the reviewer can see the feedback they just submitted.
- Add a “Back to Campaign Review” button instead of leaving the user on a terminal success screen.
- Explain the next step in one line, for example: “Your agency will update the campaign and send you a revised version for review.”
- Optionally allow the reviewer to edit or add another comment until the freelancer begins the revision.

## 5. Recommended Feature Improvements

| Priority | Feature                                | Recommendation                                                                                                                                                                                                             | Impact |
|----------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| P0       | Change Request Log / Activity Timeline | Store every change request inside the app with reviewer name, date/time, campaign, version, feedback text, and status. This creates a reliable audit trail and keeps the review process out of disconnected email threads. | High   |
| P0       | Clear Status Lifecycle                 | Use explicit states such as Draft > Sent for Review > Changes Requested > In Revision > Resubmitted > Approved. Both reviewer and freelancer should always know where the campaign currently stands.                       | High   |
| P0       | Resubmit Revised Version               | Allow the freelancer to upload or regenerate an updated campaign version and resubmit it under the same approval link. Previous feedback should remain visible.                                                            | High   |
| P0       | Resolve / Reopen Change Items          | Each requested change should be marked Open, In Progress, or Resolved. A reviewer should be able to reopen an item if the revision did not fully address it.                                                               | High   |

|           |                                    |                                                                                                                                                                                 |        |
|-----------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| <b>P1</b> | <b>Version History</b>             | Maintain v1, v2, v3, etc., with timestamps and a short note describing what changed. Final approval should clearly apply to a specific version.                                 | Medium |
| <b>P1</b> | <b>In-App Comments and Replies</b> | Allow the agency and reviewer to discuss a request directly in the app. Email should become a notification channel, not the only place where feedback lives.                    | Medium |
| <b>P1</b> | <b>Action-Oriented Dashboard</b>   | Provide an “Awaiting My Action” area showing reviews that need changes, resubmission, or approval. This reduces uncertainty and forgotten tasks.                                | Medium |
| <b>P1</b> | <b>Notifications and Reminders</b> | Notify users when feedback is received, a revised version is ready, or approval is still pending. Optional reminders can help prevent stalled campaigns.                        | Medium |
| <b>P2</b> | <b>Approval Audit Export</b>       | Allow a PDF or CSV export of the approval history, including versions, feedback, resolutions, and final approval. This is useful for agencies and compliance-sensitive clients. | Useful |
| <b>P2</b> | <b>Approval Analytics</b>          | Track average approval turnaround time, number of revision rounds, and common reasons for change requests. This can help agencies improve their production process over time.   | Useful |

## 6. Proposed End-to-End Workflow

- 1 Agency creates review** Generate approval link and send to client.
- 2 Client reviews** Approve or submit one or more change requests.
- 3 System records feedback** Create change items, timestamp them, notify the agency, and set status to Changes Requested.
- 4 Agency works revisions** Update status to In Revision and resolve each feedback item as work is completed.
- 5 Agency resubmits** Create a new campaign revision and notify the reviewer using the same review thread/link.
- 6 Client re-reviews** See the latest version alongside prior feedback and resolution status.

**Final approval** Approval is attached to the latest version and the full history remains available.

## 7. Suggested Copy Improvement for the Success Screen

### Changes requested

Your feedback has been sent to the agency and saved to this campaign review. They will make the updates and send you a revised version to review.

Suggested actions: [View request](#) | [Back to campaign](#) | [Close review](#)

## 8. Suggested Product Backlog

| Phase       | Scope                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------|
| Immediate   | Persist change requests in-app; add clear post-request CTA; add campaign status badge.                      |
| Next sprint | Add change-item resolution, resubmission, version history, and reviewer re-approval.                        |
| Later       | Add reminders, multi-reviewer approvals, exports, analytics, and optional integrations such as Slack/Teams. |

## 9. Value of the QA Function for an Email Marketing Specialist

Yes. A QA function is useful for an Email Marketing Specialist because pre-send quality control is one of the most repetitive and risk-sensitive parts of campaign production. Its value is highest when it standardizes checks that would otherwise be done manually across different clients and ESPs. The approval feature and the QA feature should be treated as complementary: QA reduces preventable production errors before the client reviews the campaign, while approval creates a documented record that the client accepted the final version.

The QA becomes particularly useful when it can consistently check or prompt the specialist to verify:

- Broken or incorrect links and CTA destinations.
- Missing or incorrect UTM parameters and inconsistent tracking conventions.
- Personalization/merge tags, fallback values, and dynamic content placeholders.
- Subject line, preheader, sender name, reply-to address, and other campaign metadata.
- Missing alt text, accessibility basics, and image-related issues.
- Required footer, unsubscribe, legal, or compliance content.

- Spelling, copy inconsistencies, placeholder text, and obvious content errors.
- Mobile responsiveness and layout checks, alongside the planned inbox and dark mode testing.
- Client-specific QA rules through reusable checklists or templates.

A useful distinction would be to separate automated checks from manual sign-off items. For example, the system can automatically detect missing links or tracking parameters, while the specialist confirms brand accuracy, offer accuracy, segmentation, and strategic intent. This would make the QA report more credible and actionable.

## 10. Additional Features That Would Strengthen the App

Inbox preview and dark mode testing are strong planned additions. Beyond those, the following features would increase the app’s usefulness for freelancers, agencies, and email teams without changing its core purpose:

| Feature                       | Recommendation                                                                                                       | Why it helps                                                                               |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Reusable QA templates         | Allow a specialist to create default and client-specific QA checklists.                                              | Makes repeated campaign checks faster and more consistent across accounts.                 |
| Inline annotations            | Let reviewers click directly on a section of the email preview and leave a comment.                                  | Removes ambiguity about which headline, image, CTA, or block needs changing.               |
| Version comparison            | Provide a simple v1 vs v2 comparison or highlight what changed after feedback.                                       | Makes re-review faster and increases confidence that requested changes were completed.     |
| Multi-reviewer approval       | Support multiple approvers, optional approval order, and named sign-off.                                             | Useful when marketing, legal, brand, or the client must all approve.                       |
| Client rules / brand checks   | Store recurring requirements such as approved sender details, tracking format, footer copy, or mandatory links.      | Reduces repetitive manual QA and client-specific mistakes.                                 |
| Campaign metadata summary     | Display subject, preheader, From name, From address, reply-to, audience/segment, send date, and ESP where available. | Lets the reviewer approve the campaign as a complete send, not only the visual email body. |
| Approval certificate / export | Generate a concise final record                                                                                      | Creates a useful handoff and                                                               |

|                         |                                                                                                |                                                                                     |
|-------------------------|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|                         | showing approver, version, timestamp, comments, and approval status.                           | audit record for client and agency files.                                           |
| Reminders and due dates | Allow a review deadline and optional reminders when approval is pending.                       | Helps prevent campaigns from being delayed by forgotten reviews.                    |
| Integrations / API      | Connect with popular ESPs and work tools so review status can sync with the existing workflow. | Reduces copying links and status updates between systems.                           |
| Access controls         | Add optional link expiry, password protection, or client-domain restrictions.                  | Improves confidence when reviewing unreleased offers or sensitive campaign content. |

## 11. Would SendCleared Aid the Day-to-Day Workflow?

Yes, particularly for freelancers and agencies managing several clients or working across multiple ESPs. A simple, documented client sign-off process adds professionalism and removes ambiguity around whether a campaign was actually approved. Instead of relying on messages such as “looks good” in email, WhatsApp, or Slack, the specialist can point to a campaign-specific approval record.

The workflow benefit becomes stronger as the number of clients increases because the same review process can be used regardless of whether a campaign was built in Klaviyo, Mailchimp, HubSpot, ActiveCampaign, or another ESP. This makes SendCleared potentially valuable as an approval layer that sits above the ESP rather than requiring a different review method for every platform.

For this to become a tool I would rely on regularly, the strongest workflow requirements would be:

- A complete revision trail after changes are requested.
- Clear ownership and status of the next action.
- Fast resubmission without creating a disconnected new review.
- A reusable QA process that reduces manual checking.
- A final approval record that can be referred to later if there is any question about what was approved.

## 12. Pricing Feedback

Figure 3. Current SendCleared pricing structure reviewed on 22 August 2026.

Seeing the complete pricing structure changes the assessment slightly. The Free plan is genuinely useful as an entry point because it already includes three approval links per month, the full 14-point QA report, an inbox preview mock, and desktop/mobile toggling. This gives a freelancer enough functionality to test the workflow before paying, which is a strong onboarding decision.

The \$19/month Freelancer plan is still somewhat expensive for a solo freelancer, but the issue is less the headline price and more the feature jump from Free to Freelancer. The paid tier mainly adds unlimited approval links and up to five client inboxes while still retaining SendCleared branding and excluding both the white-label approval page and the approval audit trail PDF. For a freelancer using SendCleared specifically to create a more professional, documented client sign-off process, the audit trail is one of the features that would most clearly justify paying.

The \$49/month Agency tier is easier to understand from a value perspective because it introduces up to 20 client inboxes, branding removal, white-label approval pages, an approval audit trail PDF, and three team seats. The \$99/month Studio tier then scales logically for larger teams by adding unlimited client inboxes, unlimited team seats, API access, and priority support.

My recommendation would be either to strengthen the Freelancer tier by including the approval audit trail PDF and perhaps a light branding option, or introduce a lower-priced Solo tier between Free and Freelancer. An annual discount could also reduce the perceived cost for independent

specialists. Full white-labeling can reasonably remain an Agency-level feature, but documented sign-off should ideally be available to the freelancer who is already paying for the product.

| Plan       | Price   | Scale / limits                                             | Key value                                                                         |
|------------|---------|------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Free       | \$0/mo  | 3 approval links/month                                     | Full 14-point QA, inbox preview mock, desktop + mobile toggle.                    |
| Freelancer | \$19/mo | Unlimited approval links; up to 5 client inboxes           | Core paid option, but no branding removal, white-label page, or audit trail PDF.  |
| Agency     | \$49/mo | Unlimited approval links; up to 20 client inboxes; 3 seats | Adds branding removal, white-label approval page, and approval audit trail PDF.   |
| Studio     | \$99/mo | Unlimited approval links, inboxes, and team seats          | Adds API access and priority support for larger studios and multi-brand agencies. |

**Pricing recommendation:** Keep the current ladder, but make the Freelancer plan feel more complete for professional client sign-off. The strongest single addition would be the approval audit trail PDF at \$19/month.

| User type                     | Likely perception of \$19/month                 | What would strengthen value                                                                                |
|-------------------------------|-------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Solo freelancer / light usage | Free tier is strong; \$19 may feel like a jump  | Consider a lower Solo tier, annual discount, or more Freelancer-only value.                                |
| Busy freelancer / consultant  | \$19 can be reasonable with regular client work | Include approval audit trail PDF; revision history and reusable QA would strengthen retention.             |
| Agency / team                 | \$49 has the clearest professional value jump   | White-labeling, audit exports, seats, multi-reviewer workflows, analytics, and integrations fit this tier. |

## 13. Final Assessment

SendCleared has a solid foundation for email campaign QA and approval because the visible client-facing experience is already straightforward: a shareable review link, a clean preview, and a simple approve/request-changes decision. The documented sign-off is genuinely useful for an Email Marketing Specialist, especially when managing several clients or working across multiple ESPs. The next stage of product maturity should focus on workflow continuity and deeper QA rather than simply adding more surface-level actions.

The strongest improvement would be to make every review decision part of a persistent campaign history. Once change requests, revisions, resolutions, QA results, and re-approvals are connected inside the same record, the app becomes more than an approval-link generator. It becomes a dependable pre-send QA and client sign-off system. Inbox and dark mode testing will further strengthen the QA proposition, while a more freelancer-friendly entry price could improve adoption among solo specialists.

### **Recommended success metric**

A reviewer should be able to answer three questions at any point without checking email: What was requested? What is the current status? What do I need to do next?
