

Send Cleared Review

What I liked and what I think could be improved.

Firstly, going over what I liked:

One of the main aspects I liked of Send Cleared is the in depth reports. Especially the spam section.

This is a big concern of mine when sending out emails, and landing in the spam folder.

And this tracking signal:

Links & tracking

60/100

⚠ WARNING

All 3 of 3 links are missing UTM parameters — campaign performance will be untrackable.

✓ PASS

Unsubscribe link is present and functional.

✓ PASS

3 links detected — no broken or malformed URLs flagged.

i INFO

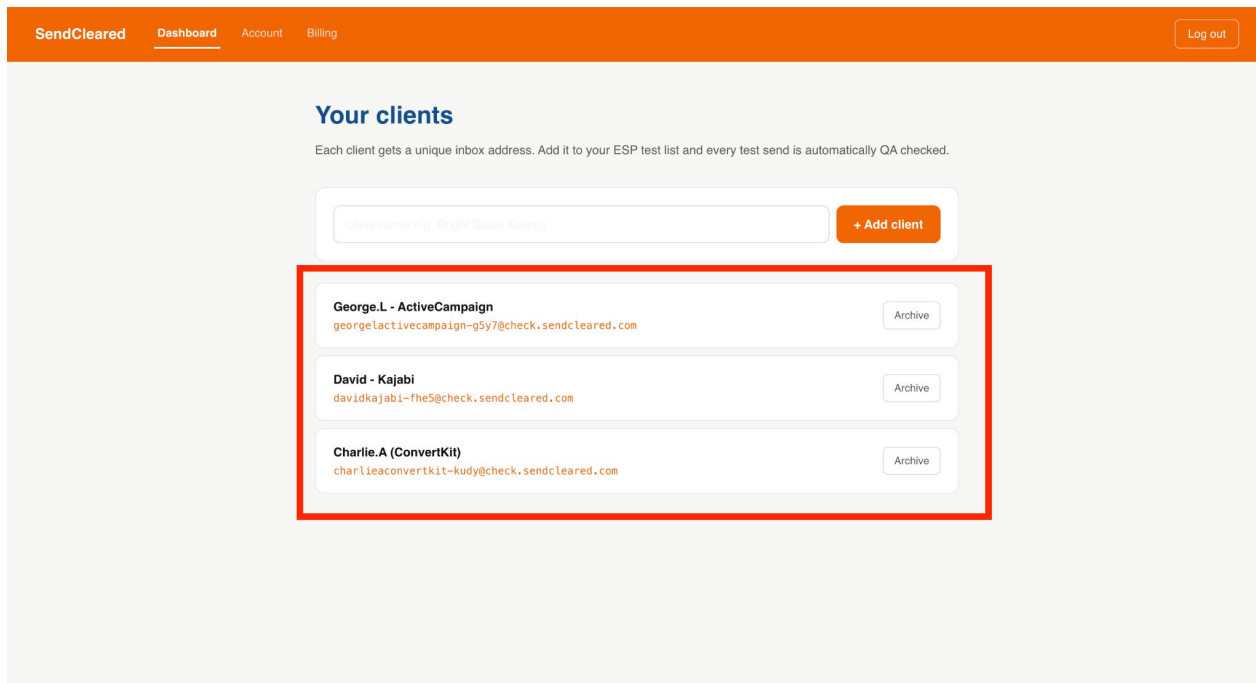

Sending domain 'b.kajabimail.net' is a standard ESP subdomain — no action needed.

I've sent out emails in the past, without the UTM code attached, and this is so frustrating, because the email I created could convert like crazy, and I wouldn't know.

So, I like this a lot.

I also like the layout how I can see all of my clients, and easily see the test emails I've sent behind each one.

Easy to access and easy to see.

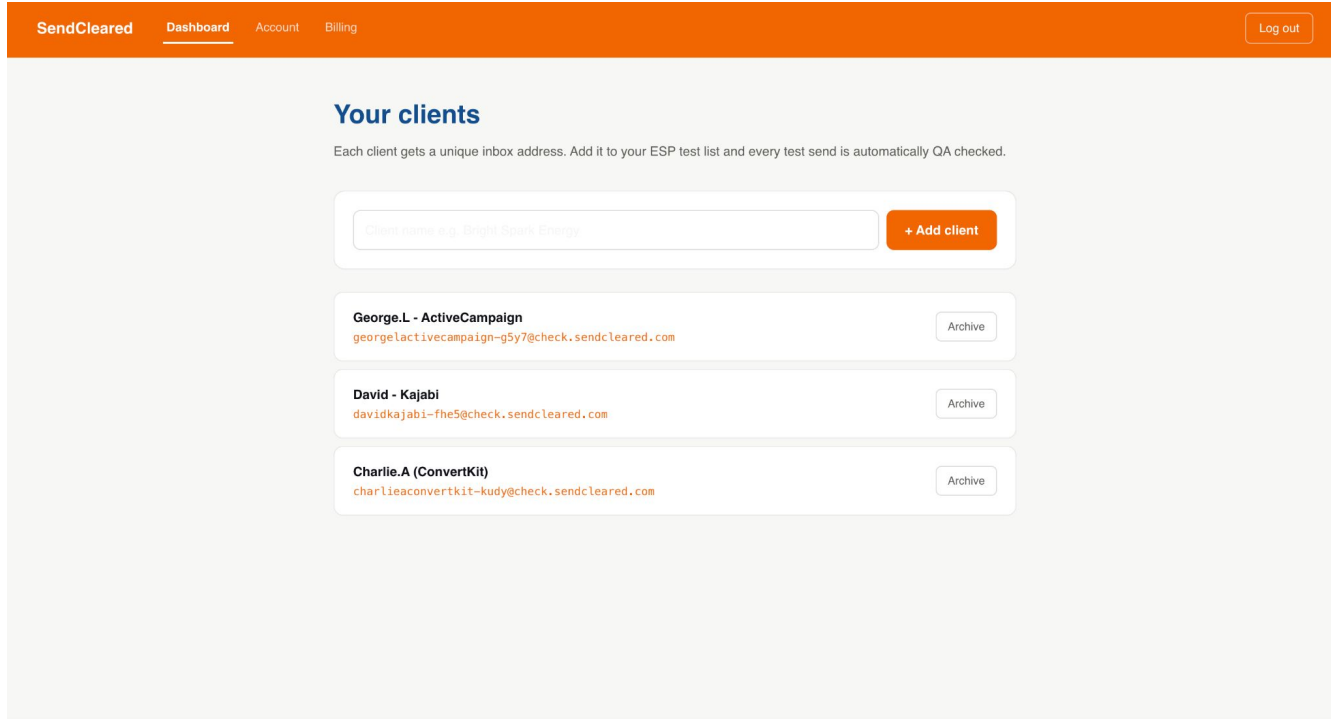

What I think could be improved.

There isn't much information on the initial page of how to actually use the software, and can be bit confusing.

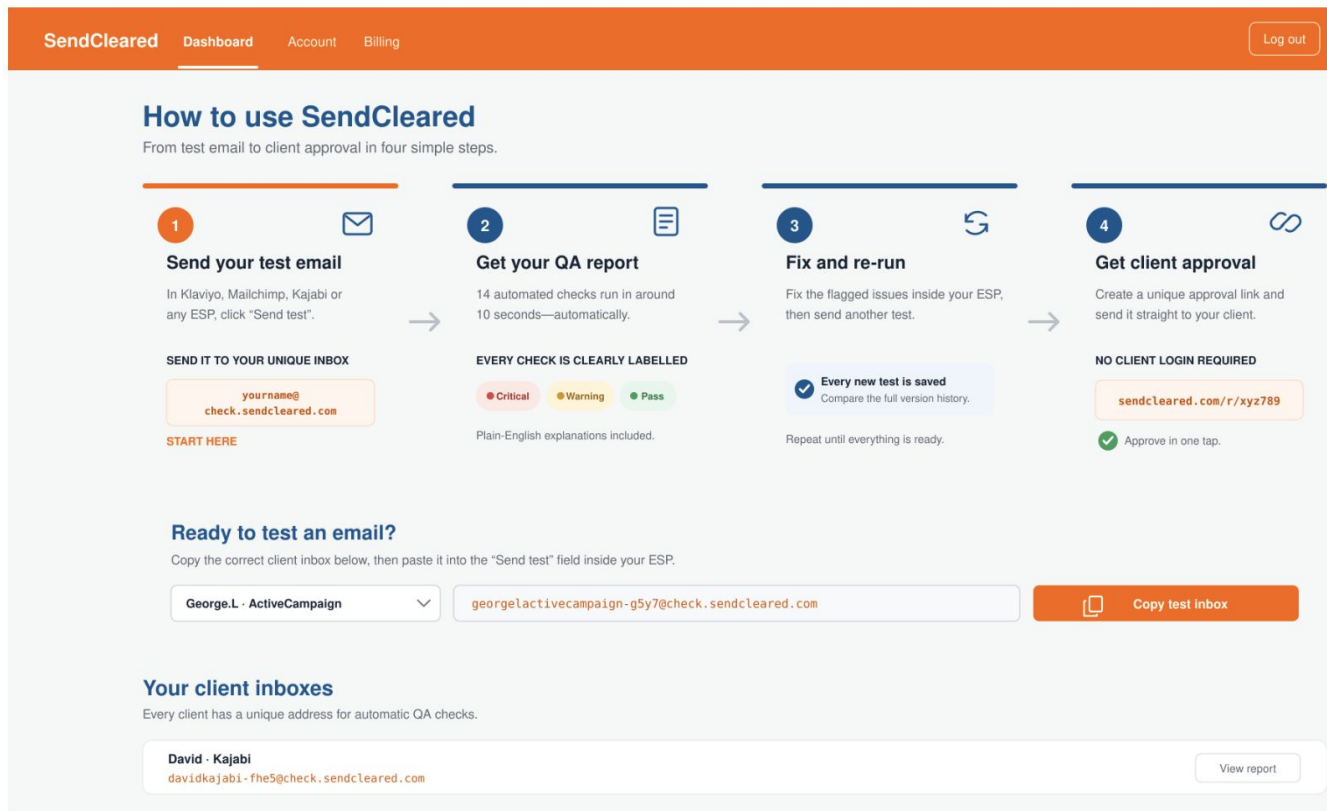

I know it says it on the landing page when they sign up, and you ran through it with me.

But after the that, it can be a bit confusing, and as they say, confusion kills conversion .

So here's what it looks like currently:

And here's a little mockup I created in ChatGPT of what it could look like:

This is what the QA report looks like:

Now, this isn't a terrible design, but I'm more thinking for the client when they look at it.

It might be a bit daunting for them to look at, and see all these terms that they might not be familiar with.

Before

SendCleared

"“Yesterday a friend said it was the best pizza he ever ate. All thanks to you.”"

From Jamie Tomlinson <jamie@emailmaximalist.com> · 19/08/2026, 16:34:13

Preview text: Not detected

This email has a critical CAN-SPAM/GDPR violation due to a missing physical address, and preview text is absent, hurting inbox engagement. Several content issues were found including an unresolved merge tag, punctuation problems, and all 4 links are missing UTM tracking parameters.

Content & copy

55/100

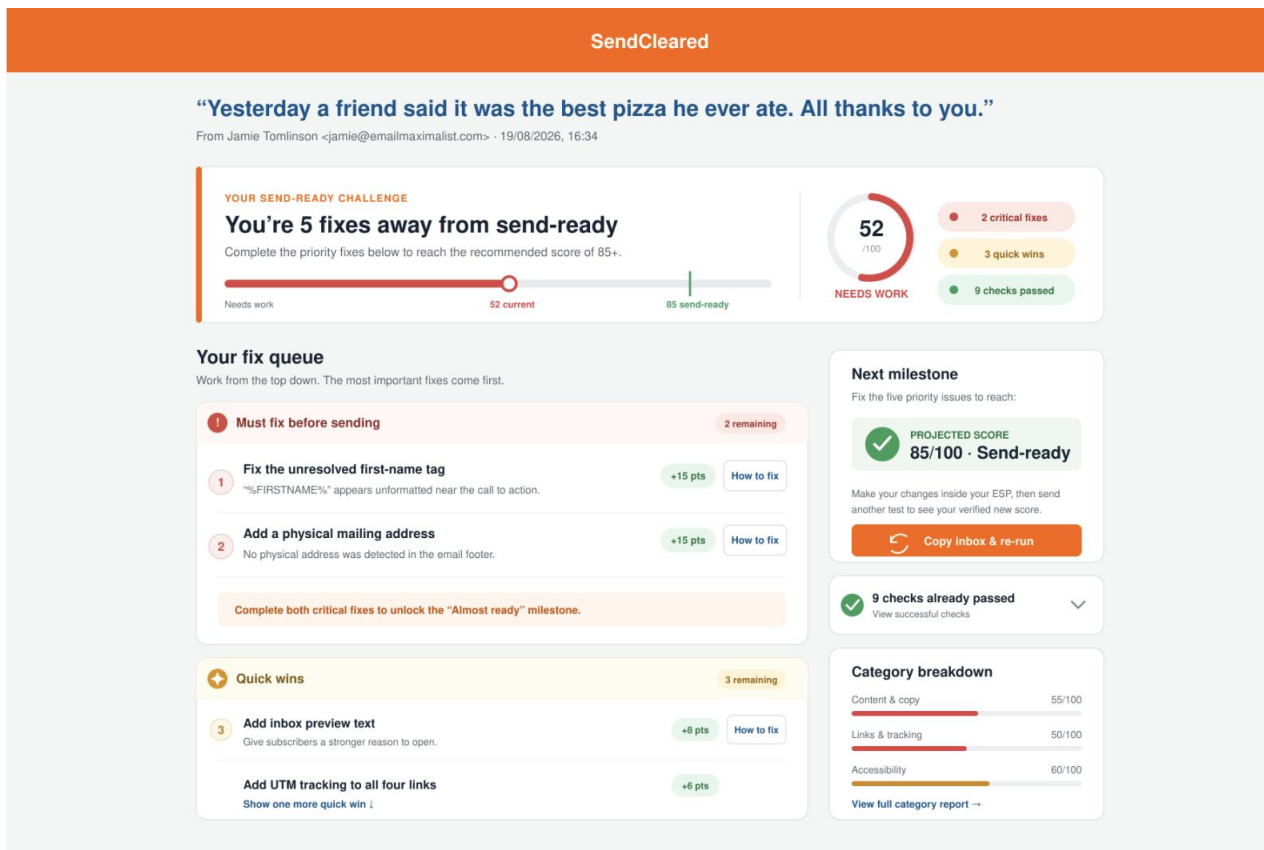

- CRITICAL** Unresolved merge tag in body: '%FIRSTNAME%' appears mid-copy near CTA.
- WARNING** Subject line opens with stray double-quote: "Yesterday a friend..." — mismatched punctuation.
- WARNING** 'Pk's results above' — 'Pk' appears to be an unformatted or incomplete name reference.
- INFO** Informal dash-heavy punctuation style is consistent with brand voice — no change needed.

Links & tracking

50/100

- WARNING** All 4 of 4 links are missing UTM parameters — campaign performance cannot be tracked.
- WARNING** 'Click here to access Total Pizza Mastery' — non-descriptive anchor text; use meaningful link labels.
- INFO** 4 links detected total — confirm CTA, unsubscribe, and any footer links are all intentional.
- PASS** Unsubscribe link is present and detected successfully.

A possible after:

A possible error in the QA report:

I noticed that for Kit and Kajabi that when I did the test reports, they both said:

“No physical mailing address detected — required by CAN-SPAM and GDPR.” - but they both did have this.

For Kajabi - it had inserts that are filled in like %FIRSTNAME% - but for the mailing address, but then on Kit, it has an address, but still came up with that error.

So, this might be something worth looking into.

Possible angles to focus on:

For the marketing side - since you're selling this to people who are working with clients like freelancers and agency owners - I think a could angle to hit would be:

SendCleared will help you get better results for your clients → Which means happier clients → This will result in longer term clients → Then this will results in more money for you → which means a better reputation → More clients

And this creates a positive flywheel effect of more clients, more money, better reputation and less headaches.

Just a thought.

Forgot to mention:

With the confirmation link - I really like the request to change.

But I think it could be integrated to somewhere in the software, maybe somewhere inside the client section.

Bonus Features:

Just an idea - and might be hard to do - but offering some kind of inbox placement.

So basing off the email and all of it's metrics - accurately saying where the email will land (primary, promotion or spam).

And if it will land in somewhere but the primary tab, suggest changes on how to get it to land in the primary tab (but this would only be for the freelancer to see, not the client).

Pricing:

Think the pricing is very reasonable - cheaper.

If you added some of the features like the inbox placement - I think you could charge a lot more.

Since freelancers would be able to say to their clients that they can say where the emails they're sending will be landing.
